

MATCHDAY AFRICA

Complete App Feature, Workflow & Operations Guide

Football intelligence · community · predictions · creator economy · Matchday War

PURPOSE A single reference for product owners, administrators, developers, content teams, support staff, partners, sponsors and future investors. It describes what the application does, how users experience it, how data moves through it, and what must be configured in production.

Document	Detail
Application	Matchday Africa with the Matchday War experience at /war
Platform	Laravel 12, Blade, Vite, JavaScript, relational database
Guide version	14 August 2026
Audience	Product, engineering, editorial, growth, commerce and operations
Status	Features verified from the current local codebase

How to use this guide

This document is both a feature catalogue and an operating manual. Sections 1–5 explain the customer experience; sections 6–10 explain engagement, content, monetisation and administration; sections 11–15 cover architecture, integrations, scheduling, security and deployment.

Contents at a glance

Section	Coverage
1–2	Product vision, audiences, navigation and account lifecycle
3–5	Football data, match centre, predictions and Matchday War
6–8	Community, personalization, discovery, creators and editorial
9–10	Growth engine, Premium, shop, sponsors and creator earnings
11–12	Admin controls, data model and system architecture
13–15	Automation, integrations, security, deployment and troubleshooting
Appendices	Myth Grammar, route map, operations checklist and glossary

SCOPE NOTE The guide describes implemented behaviour. A feature that depends on an external provider is identified as “configuration-dependent”; it becomes operational after valid credentials, callbacks, scheduler entries and/or webhooks are installed.

1. Product overview

Matchday Africa is a football platform designed to go beyond a conventional scores application. It combines live and scheduled match information with prediction games, supporter identity, social participation, African player discovery, editorial storytelling, a mythology-inspired game, and a commerce layer.

Core product pillars

Pillar	What the app provides	Primary value
Match intelligence	Fixtures, live status, scores, events, previews, standings, teams and squads	A reliable matchday destination
Participation	Predictions, leaderboards and private mini-leagues	Repeat visits and friendly competition
Identity	Favourite clubs, supporter profiles, factions, points, streaks and badges	Belonging and retention
Storytelling	Articles, match previews, creator publishing and Myth Grammar	A distinctive editorial voice
Matchday War	Character selection, CPU play, browser two-player rooms and match-linked challenges	Shareable entertainment
Growth	Referrals, email capture, campaign drafts, analytics and sharing	Acquisition and measurable distribution
Commerce	Premium, rights-safe digital products, merchandise, sponsorship and creator revenue	Diversified monetisation

Primary audiences

- Casual supporters who want fixtures and scores quickly.
- Committed fans who want previews, context, standings, squad information and alerts.
- Competitive users who make predictions and join private leagues.
- Mobile-first users who play Matchday War and share challenges.
- African football audiences discovering players across clubs and countries.
- Creators who submit stories and earn from qualified store referrals.
- Sponsors seeking measurable placements around matchday attention.
- Administrators responsible for data quality, campaigns, editorial review and revenue operations.

2. Navigation, accounts and personalization

The public navigation connects Home, Matches, Community/Leagues, War, African Players, Teams, Articles, Shop and Premium. Authenticated users additionally access predictions, their dashboard, private leagues, notification settings, profile and digital library.

Authentication and account management

- Email/password registration, login and logout.
- Password reset, password confirmation and password update.
- Email verification routes and resend workflow.
- Google sign-in and account linking when Google OAuth credentials are configured.
- Twitter/X OAuth authorization, callback and revocation when configured.
- Profile editing and account deletion.
- Role-aware access: ordinary users and administrators.

Personalized onboarding

1. A signed-in user opens onboarding.
2. The app lists active teams and allows the user to select between one and eight.
3. Selections are stored as polymorphic favourites.
4. The home experience can prioritize followed teams and the user can follow or unfollow a team from team pages.

Supporter identity

- Public supporter pages show activity and prediction statistics.
- Users can set a unique username, country, city, short biography and preferred War faction.
- Daily Flame awards 10 Matchday Points once per day.
- Consecutive daily claims increase current and best streaks.
- A seven-day streak automatically grants the Seven-Day Watch badge.

3. Football data and the match centre

The match centre is the application's factual backbone. It stores leagues, teams, matches, events, standings and players locally, while synchronization services obtain current data from configured football providers.

Home experience

- Today's fixtures with home and away teams, league, score and goal events.
- Live-match emphasis for in-play statuses.
- Featured leagues and editorial content.
- Featured match previews.
- Personalized sections for signed-in supporters.
- Optional sponsored home placement with impression tracking.

Match list and detail

- Date-based fixture browsing and live indicators.
- Score, status, minute, teams and league context.
- Goal, penalty, own-goal and disciplinary events when supplied.
- Generated preview content and featured previews.
- Public match chat viewing; authenticated message posting.
- GIF search, trending GIFs and football GIFs through Giphy when configured.
- Share links and social metadata for richer previews on social platforms.
- Enhanced match routes for richer display variants.

Leagues, standings, teams and players

- League directory, league detail and league standings.
- Team directory, team profile and squad view.
- Standing synchronization for configured leagues.
- Player synchronization for team squads.
- Country and team metadata stored locally for resilient page rendering.

DATA FRESHNESS The scheduler refreshes today's matches every 15 minutes and again hourly during peak hours. Standings update daily and player squads weekly. Production must run Laravel's scheduler every minute for these timings to execute.

4. Prediction system

Predictions are organized into administrator-created prediction sets containing one or more matches. Users submit predictions before the deadline, the scoring service evaluates completed matches, and leaderboards aggregate earned points.

Supported prediction types

Type	User predicts	Scoring behaviour
Result	Home win, draw or away win	Configured result points when correct.
Exact score	A score such as 2–1	Configured exact-score points; one consolation point for the correct outcome when the score is wrong.
First goalscorer	A named player	Scored only when sufficient event data exists; missing event data remains retryable.
Total goals	A configured total-goal answer	Evaluated against the completed match total.

User prediction workflow

1. The user opens an active prediction set.
2. The app loads attached matches and any previous submission.
3. The user enters one or more allowed prediction types.
4. Server-side validation confirms the match exists, value is present and deadline has not passed.
5. The service creates or updates the predictions and reports submitted counts and validation errors.
6. After the match finishes, scheduled scoring awards points, updates leaderboards and sends notifications.

Competition and analytics

- Global leaderboard with period and prediction-set filters.
- Personal prediction history with date, correctness and set filters.
- Personal statistics: total predictions, correct predictions, points, accuracy and rank.
- Private or public prediction groups with a six-character invite code.
- Group leaderboard based on members' accumulated prediction points.
- Administrator analytics, exports, match-level detail, transparency view and rescoring controls.
- Deadline reminders and score-update notifications.

SCORING INTEGRITY The implemented scoring state prevents already-scored predictions from being counted again. Administrators can verify results, force scoring or rescore when provider data is corrected.

5. Matchday War

Matchday War translates football rivalry into a cinematic army-and-warrior experience. It lives natively at /war and uses the same Matchday database, fixtures, teams and growth analytics as the main site.

Character and matchweek presentation

- A roster of historical/fantasy warrior archetypes mapped to football teams in the current experience.
- Card-style browsing optimized for mobile interaction.
- Matchweek fixtures can present opposing warriors face to face.

- Character imagery recedes into the battle background after kick-off while five tactical avatars per side represent the active formation.
- Three attacking avatars and two defending avatars move in response to tactical actions.
- Rights-safe wallpaper variants remove club names and protected badges for download and merchandise use.
- A character trailer/video asset and atmospheric audio assets can be presented within the War experience.

Single-player game

- Player selects a team/warrior and faces a computer opponent.
- A football sits on the pitch and visibly moves toward either goal as possession and field position change.
- ATTACK advances the ball when the player has possession.
- TACKLE/DEFEND attempts to recover possession.
- COUNTER attempts to win possession and immediately gain territory.
- SHOOT becomes meaningful in the attacking zone and can produce a goal or a save.
- The scoreboard uses team names rather than “You” and “CPU”.
- A 60-second timer represents a full football match in compressed form.
- Goal overlays, movement cues, highlighted controls and CPU animation make state changes visible.
- Optional audio commentary is off by default and can be enabled in settings.

Browser-based two-player game

1. The host creates a room, selects a team and receives a six-character code.
2. The second player opens the site on another browser/device and joins using the code.
3. The host starts only after the guest is connected.
4. Both browsers poll the shared server room state.
5. Actions are turn-based and validated against player identity, possession and match state.
6. The server updates ball position, possession, score, commentary event, turn and remaining time.
7. Rooms expire after two hours and scheduled cleanup removes abandoned rooms.

TWO-PLAYER REQUIREMENT This is browser/server multiplayer, not Bluetooth. Both devices must reach the same deployed application and database. For local mobile testing they must be on the same network and use the computer’s LAN IP; for public play they use the live domain.

Game rules implemented on the server

Action	Valid situation	Result
Attack	Side has possession	Ball advances 14 field units toward the opponent goal.
Defend/Tackle	Side does not have possession	72% recovery chance; successful tackle reclaims the ball.
Counter	Side does not have possession	58% recovery chance; success also gains 10 units of territory.
Shoot	Possession plus attacking zone	50% scoring chance; goal or save, then reset to halfway.
Invalid order	Wrong possession, range, turn or match state	Server rejects the action with an explanatory response.

6. Myth Grammar and storytelling

Myth Grammar is the distinctive language layer that translates football events into cinematic, historically inspired beats. It is used for War narration, match stories and growth campaign copy while preserving real club/team names where clarity matters.

Football event	Mythic translation
Goal	A raid lands; warriors breach the line and steal plunder or a banner.
Assist	A flank manoeuvre draws the shield wall and opens a gap.
Red card	A warrior is captured and dragged from the field in chains.
Yellow card	A warrior is struck down, wounded, and rises again.
Penalty scored	A siege tower breaches the gate.
Penalty missed	The gate holds and the siege tower collapses.
Missed big chance	A spear sails wide of its mark.
Comeback	The retreating army rallies and turns the tide.
Draw	Both banners stand at dusk; the field is shared.
Clean sheet	The fortress wall holds unbreached.
Late winner	A final charge at sunset; the last arrow finds its mark.
Manager farewell	The old chieftain lays down his sword and passes the war-banner.
Trophy won	The war council crowns a high king and holds a feast.
Relegation	The army is banished from the great council to lesser lands.
Survival	The gates narrowly hold against winter.
Hat-trick	One warrior fells three enemies in a day.
Own goal	A warrior's blade turns against a shield-brother by cruel accident.

Current generated match story behaviour

- Events are read in minute and sort order.
- Goals, penalty goals, yellow cards and red cards become narrated beats.
- Finished matches receive a winner or shared-field ending.
- Unplayed matches receive a gathering-at-the-gates introduction.
- Stories preserve the event minute, event type and generated text for timeline presentation.

7. Community, chat and social sharing

- Public match conversations can be read without an account.
- Authenticated users can post match chat messages.
- User search supports mentions and participant discovery.
- Giphy integration supports searchable and trending reaction GIFs.
- Share routes generate platform-specific sharing destinations.
- Share counts and popular-content endpoints help identify content that travels.
- Social meta components provide richer link previews.
- Analytics records page views and share-start events for anonymous and signed-in visitors.

Notifications

- Users choose match alerts, prediction reminders and a weekly digest.

- Digest day can be Monday, Friday or Sunday.
- Finished-match and scored-prediction notifications are generated by application services.
- The scheduler checks prediction reminders and score updates hourly.
- A daily scheduled command processes configured Matchday digest delivery.

8. African player discovery and creator ecosystem

African player discovery gives the platform a differentiated editorial and data focus. The creator system then lets approved contributors build stories around that football ecosystem.

African player discovery

- Dedicated African Players directory.
- Filter by supported African nationality code.
- Search players by name.
- Pagination optimized for larger datasets.
- Player detail pages include club/team relationship.
- Non-African player records are excluded from discovery detail routes.

Creator lifecycle

1. A registered supporter submits display name, biography, speciality and optional social link.
2. The application creates a pending creator profile.
3. An administrator approves or rejects the application.
4. Approved creators access Creator Studio.
5. Creators submit title, excerpt and full story; each submission enters pending editorial review.
6. Administrators publish the story or return it to draft.
7. Published posts appear on creator profiles and the public article system.

Creator commerce

- Each approved creator receives a shop URL containing their creator slug.
- A purchase through that link associates the order with the creator.
- After verified payment, the platform creates a commission record.
- The default revenue share is 10%, configurable through CREATOR_REVENUE_SHARE.
- Creators see lifetime and pending earnings in Creator Studio.
- Administrators mark commission records paid after off-platform payout.

9. Growth engine

The growth engine turns fixtures and War challenges into acquisition loops rather than treating every visit as isolated traffic.

Acquisition and referral tracking

- War email capture records consent and supports later audience activation.
- Referral journeys have a UUID plus fixture, source and campaign attribution.
- The funnel records landed, challenge, joined and completed timestamps.
- Anonymous analytics uses a first-party visitor cookie; authenticated events also attach the user ID.
- Popular-content and share-count endpoints surface high-performing pages.

Campaign generation

1. An administrator selects Generate in the War growth desk.
2. The system takes up to three high-priority fixtures within the next ten days.
3. It creates pre-match and post-match drafts for X, Instagram and TikTok.
4. Pre-match copy invites supporters to choose an army.
5. Post-match copy uses the result and Myth Grammar style.
6. An administrator approves or rejects each draft before external publication.

Automated distribution

- Daily match-link tweeting at 08:00 when Twitter credentials are valid.
- A 30-minute scheduled scan finds matches starting within two hours and prepares pre-match tweets.
- Match pages and challenge URLs supply shareable destinations.
- Campaign drafts remain human-approved; generation does not itself guarantee external publishing.

10. Monetisation and commerce

Phase 3 introduces a shared Stripe-ready commerce system across subscriptions, digital goods, physical goods, sponsor inventory and creator commissions.

Premium membership

- Public Premium landing page with monthly offer and benefits.
- Configured launch price: £3.99 per month.
- Stripe subscription Checkout when STRIPE_PREMIUM_PRICE_ID is configured.
- Verified payment stores Stripe customer/subscription IDs, active status and premium end date.
- Subscription deletion webhook cancels Premium access.
- Premium benefits are positioned as advanced intelligence, exclusive War drops and an ad-light experience.

Rights-safe shop

Product category	Current launch products	Fulfilment
Digital	Warrior Wallpaper Pack; Founders Digital Card Set	Verified payment grants a user entitlement and ZIP download in the Digital Vault.
Physical	War Council A3 Art Print; Matchday	Stripe collects shipping address for supported countries;

Product category	Current launch products	Fulfilment
	Legion Shirt	operational fulfilment is manual.
Membership	Matchday Africa Premium	Subscription activation updates the user's premium status.

Payment and fulfilment flow

1. A signed-in user chooses a product or membership.
2. The app creates a pending local order and line item.
3. The server creates a Stripe Checkout Session and redirects the browser.
4. Stripe returns the user to the success page, but this redirect is not treated as proof of payment.
5. Stripe posts a signed webhook to /stripe/webhook.
6. The app verifies the signature and accepts completed or asynchronous payment success events.
7. CommerceService marks the order paid and performs idempotent fulfilment.
8. Digital purchases grant one entitlement; memberships activate Premium; creator-attributed orders create one commission.

RIGHTS-SAFE POLICY Commercial products must use original Matchday Africa artwork without club names, club crests, league marks or other protected identity. Existing rights-safe artwork is stored under public/war/downloads/rights-safe.

Sponsor inventory

- Admin-created placements support home, predictions, matches and War slots.
- Each placement stores sponsor, headline, destination, optional image, start/end dates and active state.
- A live slot selects an eligible campaign and records an impression.
- Clicks pass through a tracked redirect and increment the campaign click count.
- Sponsor links are marked sponsored/nofollow in rendered markup.

11. Administration and operational controls

Admin area	Capabilities
Dashboard/System	Application overview, API status and cache clearing.
Data sync	Manual league, match, standing and player synchronization.
Matches	Browse, update scores, bulk-update statuses, verify, force-score and auto-update.
Predictions	Create/edit sets, attach matches, activate/close/archive, score/rescore, analytics, transparency and export.
Match previews	Generate daily, regenerate, feature/unfeature, inspect statistics and remove.
Editorial	Create/edit/publish articles, preview, moderate creator applications and submissions.
War	Review War configuration and growth campaign operations.
Twitter	Authorize, test connection, send test posts and trigger match posts.
Commerce	Revenue summary, orders, catalogue availability, sponsor creation and creator payout status.

Recommended daily operator routine

1. Check API status and today's fixture ingestion.
2. Review live-match status anomalies and missing events.
3. Confirm active prediction sets and deadlines.
4. Moderate creator submissions and match preview quality.
5. Approve relevant War campaign drafts.
6. Review failed/pending Stripe orders and new creator liabilities.
7. Check sponsor pacing, impressions and clicks.
8. Respond to user reports, then verify logs and scheduled-task health.

12. Technical architecture

The application follows Laravel's MVC/service architecture. Routes receive requests, controllers validate and coordinate, services contain integration and business logic, Eloquent models persist state, Blade renders pages, and Vite builds CSS/JavaScript assets.

Layer	Implemented responsibility
Presentation	Blade templates, reusable components, responsive Matchday/War theme, Vite-built CSS and JavaScript.
HTTP	Public, authenticated, API and admin routes; controllers; CSRF protection; admin middleware.
Domain services	Football synchronization, previews, predictions, analytics, Myth Grammar, social sharing, Stripe checkout and commerce fulfilment.
Persistence	Relational tables for football, community, prediction, War, growth, content and commerce domains.
Automation	Laravel scheduler, Artisan commands, queued preview generation and event/notification dispatch.
External boundary	Football Data, Odds API, OpenRouter, Giphy, Google OAuth, Twitter/X, Stripe and email services.

Major data domains

- Football: leagues, teams, matches, match events, standings and players.
- Prediction: sets, set matches, user predictions, results and leaderboards.
- Community: users, favourites, chats, groups, badges and notification preferences.
- Editorial: blogs, match previews, match stories and creator profiles.
- War/growth: factions, rooms, campaigns, referrals and subscribers.
- Commerce: products, orders, order items, entitlements, sponsors and creator earnings.
- Measurement: social shares and analytics events.

Key state transitions

Domain	Lifecycle
Match	Scheduled → live/in play → finished; score/events may update repeatedly.
Prediction set	Draft → active → closed → archived; individual predictions become scored after match completion.
Creator	Pending → approved/rejected; submission draft → pending review → published/returned.
War room	Waiting → ready → playing → finished/expired.
Order	Pending → paid; failed/refunded states are reserved in the data model.

Domain	Lifecycle
Sponsor	Inactive/scheduled → live during date window → ended.

13. Integrations and configuration

Integration	Purpose	Important environment values
Football Data	Leagues, fixtures, scores, standings, teams and players	FOOTBALL_DATA_API_KEY, base URL, cache/rate settings
Odds API	Weekend, upcoming and match odds endpoints	ODDS_API_KEY, URL, regions, markets
OpenRouter	AI-assisted match preview generation	OPENROUTER_API_KEY, model, daily limit
Giphy	Chat reactions	GIPHY_API_KEY
Google OAuth	Authentication/account linking	GOOGLE_CLIENT_ID, GOOGLE_CLIENT_SECRET, redirect URI
Twitter/X	OAuth and automated distribution	Twitter client/API credentials and tokens
Stripe	Checkout, subscription and verified fulfilment	STRIPE_KEY, STRIPE_SECRET, STRIPE_WEBHOOK_SECRET, STRIPE_PREMIUM_PRICE_ID
Email	Password resets, notifications and digest	Configured Laravel mail transport/Resend/Postmark/SES/Mailgun values

SECRETS Production secrets belong only in the server environment. Do not commit the live .env file. After changing environment values, clear and rebuild Laravel configuration cache.

14. Scheduling, queues and data freshness

Frequency	Task
Every 5 minutes	Score eligible predictions.
Every 15 minutes	Synchronize today's matches.
Every 30 minutes	Look for matches within two hours and trigger pre-match Twitter workflow.
Hourly	Send prediction reminders/score notifications; clean expired War rooms.
14:00–23:00 hourly	Additional peak-hours match synchronization.
00:00 daily	Clear application cache.
03:00 daily	Synchronize standings.
08:00 daily	Process Matchday digest and scheduled match-link tweets.
Sunday 04:00	Synchronize player squads.
Weekly	Clean old application logs.

Required server jobs

- Cron every minute: php artisan schedule:run.
- A long-running queue worker when queued preview generation or asynchronous jobs are used: php artisan queue:work --tries=3.
- Log rotation/monitoring appropriate for cPanel or the production host.

- HTTPS and a public callback URL for OAuth and Stripe webhooks.

15. Security, privacy and reliability

- Laravel CSRF protection covers browser write routes; only the Stripe webhook path is excluded because Stripe authenticates with a signature.
- Passwords are hashed through Laravel authentication.
- Admin routes require authentication plus AdminMiddleware.
- Two-player War actions validate a UUID player token, room membership, turn and state.
- Checkout requires authentication, and digital downloads require a matching entitlement.
- Stripe webhook signatures are verified before fulfilment.
- Commerce fulfilment is idempotent to prevent duplicate grants or commissions from repeat webhooks.
- Queries validate model existence and input constraints.
- Analytics stores a first-party visitor identifier and optional user ID; production privacy notices and consent controls should describe this.
- War subscriber records include consent and unsubscribe timestamps.
- Scheduled tasks log errors so operational failures can be diagnosed.

Known operational boundaries

- Physical merchandise fulfilment is not connected to a print-on-demand provider; staff must fulfil paid orders manually or add a future integration.
- Creator payout marking is an internal ledger action; it does not transfer money automatically.
- Premium currently records a one-month access horizon when checkout completes; advanced renewal period synchronization can be expanded with invoice/subscription update webhooks.
- The two-player game uses HTTP room polling and a shared database; it is not peer-to-peer or Bluetooth.
- External-data accuracy depends on provider coverage, quota and event completeness.
- Audio commentary quality depends on browser speech/audio support and the assets selected for production.

16. Deployment to cPanel / matchday.africa

The Laravel application is intended to run from the domain root, with Matchday War available at /war. The web server document root must point to Laravel's public directory, never the repository root.

Deployment sequence

1. Upload or deploy the application outside the public web root where practical.
2. Point the domain document root to matchday-africa/public.
3. Create the production database and set DB_CONNECTION plus credentials in .env.
4. Set APP_ENV=production, APP_DEBUG=false, APP_URL=https://matchday.africa and generate APP_KEY.
5. Install PHP dependencies with Composer's optimized production flags.
6. Install/build frontend dependencies or upload the compiled public/build directory.
7. Run all database migrations with --force.

8. Create storage link, set writable permissions for storage and bootstrap/cache.
9. Configure all required provider credentials and exact OAuth callback URLs.
10. Register the Stripe webhook at <https://matchday.africa/stripe/webhook>.
11. Create scheduler and queue-worker jobs.
12. Cache configuration, routes and views, then run health and feature checks.

Essential commands

```
composer install --no-dev --optimize-autoloader
```

```
php artisan key:generate (first deployment only)
```

```
php artisan migrate --force
```

```
php artisan storage:link
```

```
npm ci && npm run build
```

```
php artisan config:cache
```

```
php artisan route:cache
```

```
php artisan view:cache
```

```
php artisan test
```

Post-deployment acceptance checks

- Home, login, registration, matches, leagues, teams, articles, players, shop, Premium and /war return successfully.
- A test account can follow a team, predict, claim Daily Flame and join a private prediction league.
- Administrator can sync data and access all admin pages.
- Stripe test checkout reaches the success page and a signed webhook changes the order to paid.
- Purchased digital item appears in the user library and downloads.
- Two browsers can create, join and complete a War room.
- Scheduler and queue logs show successful execution.
- Mobile layouts remain usable without horizontal overflow.

Appendix A. Public route guide

Area	Main routes
Core	/, /matches, /matches/{id}, /leagues, /leagues/{id}, /teams, /teams/{id}
Content	/blogs, /blogs/{slug}, /african-players, /african-players/{id}, /creators/{slug}
Participation	/predictions, /predictions/history, /predictions/leaderboard, /prediction-leagues
Identity	/onboarding, /supporters/{id}, /profile, /notification-settings, /dashboard
War	/war, /war/match/{id}, /war/challenge/{id}, /war/api/fixtures, /war/api/rooms
Commerce	/premium, /shop, /checkout/{product}, /library, /stripe/webhook
Social	/share/{type}/{id}/{platform}, /matches/{id}/chats, /gifs/*

Appendix B. Operations checklist

Before every matchweek

- Confirm fixtures are synchronized through the next 10–14 days.
- Verify featured leagues, team mappings and War factions.
- Create/activate prediction sets and check deadlines.
- Generate previews and inspect factual accuracy.
- Generate War campaigns, revise and approve selected drafts.
- Confirm sponsor date windows and destination URLs.
- Check scheduler, queue, mail and provider quotas.

After matches finish

- Verify final scores and important match events.
- Confirm prediction scoring completed and leaderboards moved.
- Resolve unscored first-goalscorer predictions when event data was delayed.
- Review generated Myth Grammar stories and post-match campaigns.
- Check War referral completion and sharing performance.
- Review commerce, sponsor and creator-revenue dashboards.

Appendix C. Glossary

Term	Meaning
Prediction set	An administrator-defined collection of matches and prediction opportunities.
War faction	The warrior identity associated with a football team.
Myth Grammar	The translation rules turning football events into mythic narrative beats.
War room	A temporary server-side state container for a browser two-player match.
Entitlement	A record proving a user owns a digital product and may download it.
Sponsor slot	A named page location that can display one eligible sponsor placement.
Creator earning	A commission ledger entry created by a paid creator-attributed order.
Idempotent fulfilment	Processing that safely produces the same result when a webhook is delivered more than once.

Document control

This guide was generated from the application routes, controllers, services, models, migrations, views and scheduler present in the local Matchday Africa codebase. It should be updated whenever a phase changes user-facing behaviour, external integrations, database structure, scheduled tasks or deployment requirements.
